On the Softmax Bottleneck of Recurrent Language Models : Supplementary Material

Dwarak Govind Parthiban, 1 Yongyi Mao, 1 Diana Inkpen 1

¹ University of Ottawa yottabytt@gmail.com, ymao@uottawa.ca, diana.inkpen@uottawa.ca

1 Tables explicitly referenced in the paper

Model	Test ppl	p-value					
Pe	Penn Treebank dataset						
Softmax	57.08 ± 0.10	N/A					
SS	57.03 ± 0.15	3.92×10^{-1}					
GSS	57.02 ± 0.13	2.62×10^{-1}					
LMS-PLIF	56.81 ± 0.11	1.91×10^{-5}					
MoS	54.88 ± 0.26	2.02×10^{-15}					
	WikiText-2 datas	set					
Softmax	64.63 ± 0.09	N/A					
SS	64.35 ± 0.18	3.46×10^{-4}					
GSS	64.51 ± 0.13	2.74×10^{-2}					
LMS-PLIF	64.15 ± 0.17	2.98×10^{-7}					
MoS	61.97 ± 0.43	2.04×10^{-13}					

Table 1: p-value resulting from unpaired t-tests between samples of test perplexities of different models and that of the Softmax model. Each model was trained 10 times using 10 randomly sampled seeds for random initialization of the parameters in the model. Values mentioned as $x \pm y$ denote the mean \pm one standard deviation.

2 Details about hyperparameters and hyperparameter finetuning

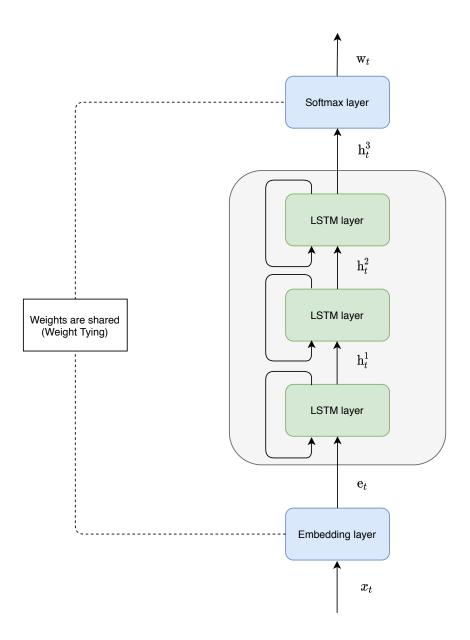

Figure 1: A rolled-up AWD-LSTM network

2.1 Notable differences in hyperparameters for models under comparison

We used the hyperparameters reported by Merity, Keskar, and Socher (2018) for Softmax, SS, GSS, and LMS-PLIF models. For MoS and MoC, we used the hyperparameters reported by Yang et al. (2017). Some of the notable differences among these two sets of hyperparameters are shown in Table 6. The common hyperparameter values in both these sets are 0.1 for embedding matrix dropout, 0.4 for dropout on \mathbf{h}_t^3 (Figure 1), 0.5 for dropconnect on LSTM weights, 1.2e-6 for scaling factor of L2 regularization (weight decay), 2 and 1 for scaling factors of activation and temporal activation regularization.

	For Softmax, SS, GSS, and LMS-PLIF		For MoS and MoC	
Hyperparameter	Data	a set	Data set	
11) per pur uniceer	PTB	WT2	PTB	WT2
$\overline{\text{Dropout for }\mathbf{e}_t}$	0.4	0.65	0.4	0.55
$\overline{\text{Dropout for }\mathbf{h}_t^1,\mathbf{h}_t^2}$	0.3	0.2	0.225	0.2
Learning rate	20.0	30.0	20.0	15.0
Batch size	20	80	12	15
Random seed	141	1,881	28	1,881
$\overline{dim(\mathbf{e}_t)}$	400	400	280	300
$\overline{dim(\mathbf{h}_t^1), dim(\mathbf{h}_t^2)}$	1,150	1,150	960	1,150
$\overline{dim(\mathbf{h}_t^3)}$	400	400	620	650

Table 6: Differences in hyperparameters. dim(.) denotes the dimension. Refer Figure 1 to know about \mathbf{e}_t , \mathbf{h}_t^1 , \mathbf{h}_t^2 , \mathbf{h}_t^3

2.2 Hyperparameters specific to the PLIF layer and the MoS layer

As LMS-PLIF and MoS models has extra trainable parameters in the form of PLIF and MoS layers, there are a few hyperparameters which are exclusive to them. We obtained the values of the hyperparameters exclusive to the PLIF layer through a discussion with Ganea et al. (2019). For the PLIF layer (Ganea et al. 2019), on both datasets, K was set to 10^5 ; T was set to 20; a layer specific learning rate of 0.02 was used. For the MoS layer, as reported by Yang et al. (2017), on both datasets, a dropout of 0.29 was used and the number of mixtures K=15 was used.

2.3 Hyperparameter finetuning for comparing MoS and Softmax models

From the works of (Wang, Gong, and Liu 2019; Wang et al. 2020), we came to know that adding small gaussian noise to \mathbf{e}_t (Figure 1) helps in better performance. Hence, we also included this as a hyperparameter (which we call embedding noise) in the set of hyperparameters that we used for making the Softmax model to perform as good as that of the MoS model on PTB dataset. As shown in Tables 7 and 8, we finetuned only a total of six hyperparameters in two stages, and used the best performing hyperparameter values for MoS† and Softmax‡ models. The cross product of the set of values for hyperparameters were used for the search.

Hyperparameter	Values used
Dropout for \mathbf{e}_t	0.2, 0.4
$\overline{\text{Dropout for }\mathbf{h}_t^1,\mathbf{h}_t^2}$	0.225, 0.3
Embedding noise	0.10, 0.15

Table 7: First stage of hyperparameter finetuning for both MoS and Softmax models

Hyperparameter	Values used
Embedding matrix dropout	[0.075, 0.125](0.025)
$\overline{\text{Dropout for } \mathbf{e}_t}$	[0.28, 0.34](0.01)
$\overline{\text{Dropout for }\mathbf{h}_t^1,\mathbf{h}_t^2}$	[0.20, 0.35](0.025)
$\overline{\text{Dropout for }\mathbf{h}_t^3}$	0.26
Embedding noise	[0.10, 0.20](0.025)
Weight decay	[1.2e-6,1.5e-6](0.1e-6)

Table 8: Second stage of hyperparameter finetuning for both MoS and Softmax models. [x,y](z) denote the values between x and y with a step size of z.

Hyperparameter	r Final valı	
	Softmax‡	MoS†
Embedding		
matrix dropout	0.125	0.1
$\overline{\text{Dropout for } \mathbf{e}_t}$	0.28	0.4
$\overline{\text{Dropout for }\mathbf{h}_t^1,\mathbf{h}_t^2}$	0.225	0.225
Dropout for \mathbf{h}_t^3	0.26	0.4
Embedding noise	0.15	0.10
Weight decay	1.5e-6	1.2e-6

Table 9: Best performing hyperparameter values after two stages of finetuning for MoS† and Softmax‡ models.

3 Other supporting tables for claims made in the paper

The performance differences when ET-ASGD (epoch number 200) is used over NT-ASGD (non monotone interval 5) for models on both PTB and WT2 datasets are shown in Tables 10 and 11 respectively.

Model	#Param	Train ppl	Validation ppl	Test ppl	Rank		
	NT-ASGD						
Softmax	24.22M	34.05	60.35	58.07	402

Table 11: Performance comparison for NT-ASGD vs ET-ASGD on WT2

We showed, for MoS models, that rank can be increased without increasing the number of mixtures but by adjusting the dropout rates of the MoS layer. The complete results for that experiment on both PTB and WT2 datasets are shown in Table 12.

Dropout	Train ppl	Test ppl	Rank			
	Penn Treebar	nk dataset				
0.29	33.08	56.07	9,979			
0.145	29.21	59.09	9,985			
0.00	23.81	64.82	9,992			
	WikiText-2 dataset					
0.29	39.11	63.06	13,215			
0.145	32.19	64.38	17,256			
0.00	27.51	68.49	19,427			

Table 12: MoS model for different dropout rates applied to the MoS layer. All the models use 15 mixtures.

4 Other relevant observations

4.1 About word similarity benchmarks

As the vocabulary sizes of PTB and WT2 datasets are 10,000 and 33,278 respectively, it can be understood that not all word pairs in the benchmarks can be present in the vocabulary. A brief summary about this statistics is shown in Table 13.

Dataset	# Pairs	# Pairs not in PTB	# Pairs not in WT2
WS-353	353	116	48
